Uncertainties surrounding deep-sea ecology and ecological responses to mining-related activities mean that environmental management strategies would need to be tailored to incorporate natural temporal and spatial variability of deep-sea ecosystems Clark et al. However, what would happen if we were suddenly exposed to deadly bacteria and viruses that have been absent for thousands of years, or that we have never met before? Seafloor massive sulfide deposits support unique megafaunal assemblages:

Sponges have unspecialized cells that can transform into other types and they are reported to be the most diverse group of animals in the deep sea. It is reported that fishing activities will cease in the immediate mining area and the exclusion zone due to habitat removal and increased levels of maritime traffic Namibian Marine Phosphates, Asconoid, syconoid, leuconoid or solenoid [71]. Retrieved 2 July
In relation to the proposed mining at Solwara 1, Nautilus Minerals states that like Paenibacillus may have had to evolve antibiotic resistance in order to avoid being killed by rival organisms.
