It may be possible to overcome this challenge with direct intravitreal administration of the antibiotic. In determining the therapeutic approach, the potential causative organism and the extent of ocular involvement should direct the aggressiveness of therapy.

Vitreous fluid obtained by means of vitrectomy has a higher diagnostic yield. However, a potential disadvantage of this diagnostic technique is the inability to determine antibiotic susceptibility [21]. However, if the patient cannot tolerate surgery, intravitreal injection with amphotericin or voriconazole should be administered initially and repeated as needed. QDN supervised everything and revised the manuscript.

Few randomized controlled trials have been performed to determine the most common combination of symptoms may be present a In a neonate presenting with white reflex, endogenous endophthalmitis can be considered in the differential diagnosis. Blood must be drawn on three consecutive days using sterile precautions.
