This conversion can be detected immunologically as it results in the exposure of the cryptic cross-reacting determinant CRD [-]. The ability of the GPI-PLC to catalyze the shedding of the VSG coat in vitro, and the contemporaneous expression of the two proteins, has led to the models that suggest an important role for the enzyme in the developmental changes that involve alterations in the expression of cell surface proteins [The African Trypanosomes (World Class Parasites). C During the different stages of infection, the host produces different mononuclear phagocyte system MPS polarizing molecules. From the bite, parasites first enter the lymphatic system and then pass into the blood. Based on the mode of transmission by their insect vector, the genus Trypanosoma is divided in two main groups: Sleep-wake disturbances may result from invasion of the median eminence by parasites, which also accounts for neuro-endocrine dysfunctions with the involvement of the suprachiasmatic nuclei. J Immunol Parasite Immunol The resistance to drugs for the African trypanosomes has been shown to be associated with reduced drug uptake by the parasites stressing the importance

of drug transporter reviewed by [].
